

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please CANCEL without prejudice or disclaimer claims 1-10 the underlying PCT application and ADD new claims 11-20 in accordance with the following:

Claims 1-10 (cancelled).

11. (New) An electrical machine, comprising:

a rotor rotatably mounted;

a stator associated with said rotor in a stationary position; and

a cooling device, cooling at least parts of said stator, including

 a refrigeration unit having at least one cold surface; and

 a closed line system, thermally coupling said refrigeration unit to the parts of said stator to be cooled, having discrete coolant areas associated with the parts of said stator to be cooled, and in which a coolant is circulated by a thermosiphon effect, the coolant being heated or at least partially vaporized in the discrete coolant areas.

12. (New) The machine as claimed in claim 11, further comprising a condenser area where said closed line system is thermally coupled to the cold surface of said refrigeration unit.

13. (New) The machine as claimed in claim 12, wherein the discrete coolant areas are thermally conductively connected over a large area to the stator parts to be cooled.

14. (New) The machine as claimed in claim 13,

 wherein said stator has a laminated core, and

 wherein the discrete coolant areas are formed between laminates of the laminated core of said stator.

15. (New) The machine as claimed in claim 12, wherein the discrete coolant areas are formed as cooling channels.

16. (New) The machine as claimed in claim 15, further comprising flow paths for air cooling.

17. (New) The machine as claimed in claim 11, wherein the discrete coolant areas are thermally conductively connected over a large area to the stator parts to be cooled.

18. (New) The machine as claimed in claim 17,
wherein said stator has a laminated core, and
wherein the discrete coolant areas are formed between laminates of the laminated core of said stator.

19. (New) The machine as claimed in claim 11, wherein the discrete coolant areas are formed as cooling channels.

20. (New) The machine as claimed in claim 19, further comprising flow paths for air cooling.
